In this issue:

- > The development of equipment for OnVu ICE labels
- > Serial production

The innovative development from the Labor-Innovation GmbH, the BASF- label printer for OnVu labels which makes `freshness visible`.

The label reader that can do more...

Besides the conventional printing process for labels, this new generation printer is developed for a specific UV activation process for OnVu TTI labels including the subsequent finishing process and application of a protective film.

The specifically developed software to control and regulate the UV exposer is working in combination with and can be defined via netbook or tablet.

The UV activation in association with the print layout can be triggered in the closed unit via a start button. The finished labels will be dispensed automatically.

The first appliances are already in use by BASF with additional appliances in production.

Customer-centred project BASF (Ciba)
We are very grateful to have been entrusted with this complex project and are excited to deliver this innovative appliance to satisfy the specific needs and application of our customer. Furthermore with this new technology we have achieved a big step towards achieving new heights in printing technology.

The OnVu label that makes `freshness visible`, is the reliable control system made possible with the `intelligent` labels and complementing technology.

colourless

expired shelf life

The speed the colour changes from blue to colourless is dependent on the ambient temperature.
